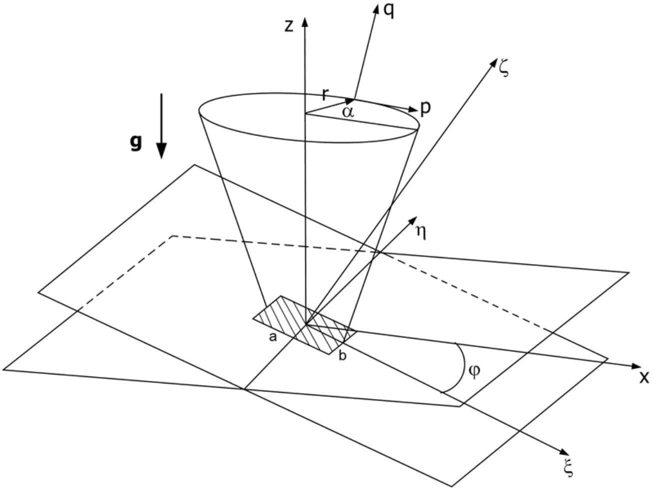
System coordinate frame for analytical calculation



Governing equations and boundary conditions

Governing equations

$$\frac{\partial\rho}{\partial t} + \mathbf{v}\nabla\rho = 0, \quad \text{div}\ \mathbf{v} = 0$$

$$\frac{\partial\mathbf{v}}{\partial t} + (\mathbf{v}, \nabla)\,\mathbf{v} = \frac{1}{\rho}\nabla p + \nu\Delta v + \rho\mathbf{g}$$

$$\frac{\partial S}{\partial t} = \kappa_S \Delta S + \frac{v_z}{\Lambda}$$

Boundary conditions

$$\mathbf{v}\big|_\Gamma = \mathbf{u}_0 e^{-i\omega t}, \quad \kappa_S \left.\frac{\partial S}{\partial n}\right|_\Gamma = \frac{1}{\Lambda} \left.\frac{\partial z}{\partial n}\right|_\Gamma$$

$$v \to 0, \quad \rho \to \rho_0, \quad \partial P/\partial z \to \rho_0\,(z)\,g, r \to \infty$$

Toroidal-poloidal decomposition

$$\mathbf{v} = \nabla \times \mathbf{e}_z\Phi + \nabla \times (\nabla \times \mathbf{e}_z\Psi)$$

System equations for functions Φ and Ψ

$$\left(\left(\frac{\partial}{\partial t} - D\Delta\right)\left(\frac{\partial}{\partial t} - \nu\Delta\right)\Delta + N^2\Delta_\perp\right)\ \Phi = 0$$

$$\left(\frac{\partial}{\partial t} - \nu\Delta\right)\ \Psi = 0$$

$$\left(\left(\frac{\partial}{\partial t} - D\Delta\right)\left(\frac{\partial}{\partial t} - \nu\Delta\right)\Delta + N^2\Delta_\perp\right)\ S = 0$$

where

$$\Delta_\perp = \partial_x^2 + \partial_y^2 \quad \Delta = \partial_x^2 + \partial_y^2 + \partial_z^2 \quad N^2 = \sqrt{\frac{g}{\Lambda}}$$

Construction solution for Φ and Ψ in Fourier transform

$$\Phi = e^{-i\omega t} \sum_{j=1}^{3} \int\limits_{-\infty}^{+\infty} A_j \left(k_\xi, k_\eta\right) E_j \; dk_\xi dk_\eta$$

$$S = -\frac{\rho_0}{\Lambda} e^{-i\omega t} \sum_{j=1}^{3} \int\limits_{-\infty}^{+\infty} \frac{\left(k_\xi \cos\varphi - k_j \sin\varphi\right)^{2} + {k_\eta}^{2}}{i\omega - \kappa_S \, k^2} A_j \left(k_\xi, k_\eta\right) E_j dk_\xi dk_\eta$$

$$\Psi = e^{-i\omega t} \int\limits_{-\infty}^{+\infty} B \left(k_\xi, k_\eta\right) \; E_4 dk_\xi dk_\eta$$

where

$$E_j = \exp\left(ik_j\zeta + ik_\xi\xi + ik_\eta\eta\right), \quad k = \sqrt{k_j^2 + k_\xi^2 + k_\eta^2}$$

Viscous stratified fluid take into diffusion

Dispersion equation

$$\left(\nu\kappa_S\tilde{k}^6 - i\omega\left(\nu+\kappa_S\right)\tilde{k}^4 - \omega^2\tilde{k}^2 + N^2k_\perp^2\right)\left(\tilde{k}^2 + \frac{\omega}{i\nu}\right) = 0$$

$$\tilde{k}^2 = 2k_\zeta^2 + k_\perp^2, \quad k_\perp^2 = k_\xi^2 + k_\eta^2$$

Viscous stratified fluid take into diffusion

Regular solution(waves)

$$k_1 = \frac{k_\xi \sin\varphi\cos\varphi \pm \kappa\cos\theta}{\mu_\theta} \pm \delta_N^2 (1+\varepsilon)\frac{i\ \tan\theta\mu_\theta^4}{2\kappa\mu^4} + \ldots$$

$$\mu = \sin^2\varphi - \sin^2\theta, \quad \mu_\theta = (k_\xi \sin\varphi\cos\varphi \pm \kappa\cos\varphi),$$

$$\varepsilon = Sc^{-1} = \frac{\kappa_S}{\nu}, \quad \delta_N = \sqrt{\frac{\nu}{N}}$$

Singular solution

$$k_{2,\,3} \approx \sqrt{\frac{i\omega(\varepsilon + 1 \pm \lambda_{\nu\kappa})}{\varepsilon}}, \quad \lambda_{\nu\kappa} = \frac{2}{\sin\theta}\sqrt{(1+\varepsilon)^2 - \frac{4\varepsilon\mu}{\sin^2\theta}}$$

$$k_4 = \sqrt{\frac{2i}{\delta_\nu^2} - k^2}, \quad \delta_\nu = \delta_N\sqrt{\frac{2}{\sin\theta}}, \quad \delta_\varphi = \delta_N\sqrt{\frac{2\sin\theta}{|\mu|}}, \quad \delta_\kappa = \delta_N\sqrt{\frac{2\varepsilon}{\sin\theta}}$$

Viscous stratified fluid take into diffusion. Vetrical component of the velocity

$$v_\zeta \approx \int\limits_{-\infty}^{+\infty} A_1 \left(k_\eta^2 \sin\varphi - k_\xi \beta_1\right) E_1 dk_\xi dk_\eta -$$

$$-ie^{\frac{i-1}{\delta_\nu}\zeta} \sin\varphi \int\limits_{-\infty}^{+\infty} BE_{\xi\eta}\, dk_\xi dk_\eta - \frac{i+1}{\delta_\varphi} e^{\frac{i-1}{\delta_\varphi}\zeta} \cos\varphi \int\limits_{-\infty}^{+\infty} A_2 k_\xi E_{\xi\eta} dk_\xi dk_\eta -$$

$$-\frac{1+i}{\delta_\kappa}\sqrt{\frac{\sin\theta}{2}} e^{-\frac{\sqrt{\sin\theta}}{\delta_\kappa\sqrt{2}}\zeta + \frac{i\zeta}{\delta_\kappa\sqrt{2}}} \cos\varphi \int\limits_{-\infty}^{+\infty} A_3 k_\xi E_{\xi\eta} dk_\xi dk_\eta$$

where

$$E_{\xi\eta} = exp\left(ik_\xi \xi + ik_\eta \eta\right)$$

Why OpenFOAM?

Pluses:

1. OpenFOAM free and open source, under the GNU general public licence (GPL).
2. Support of community: `http://www.cfd-online.com/Forums/openfoam`, `http://openfoamwiki.net`, `http://stackoverflow.com/`
3. Support open-source Linux platform (openSUSE, Ubuntu, RHEL)

Minuses:

1. No GUI to create grids, but can use other applications such as: GMSH (**http://geuz.org/gmsh/**), Salome (**http://www.salome-platform.org/**) or commercial mesh generators such as: Icem CFD (**www.ansys.com**), Gambit (**www.ansys.com**), pro*star Star-CD (**www.cd-adapco.com**)

Hardware, software and workflow process

Platform: 8 cpu, 32 Gb
Software: CentOS 6,
OpenFOAM-2.2.2

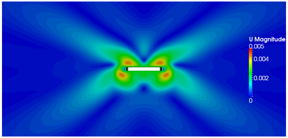
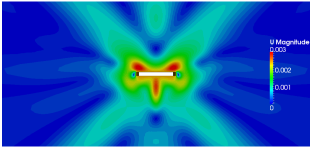
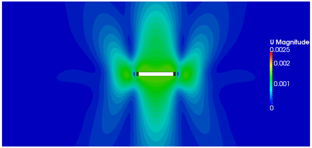
$N = 2.8\ s^{-1}$



$N = 1.46\ s^{-1}$



$N = 2.8\ s^{-1}$



$N = 0.58\ s^{-1}$

Conclusion

1. In the general case, in a viscous stratified fluid there are two types of solutions: regular (waves) and three type singular solutions. Two of them don't have analogues in homogeneous fluid. Their properties are defined viscosity, stratification, diffusion and the geometry of the problem;
2. For a complete description of the flow of fluid you must consider all parameters (viscosity, stratification, diffusion);
3. Create solver for calculation of the internal gravity waves in a continuesly stratified fluid;
4. Calculations case horizontal plate for two types of the sources: friction and piston.
